

Natural Disasters, Globalization and Risk Reduction: A Disaster Risk Management Perspective for Sustainable Development

Disaster Risk Management (DRM) has recently become a significant concern for development cooperation among international and non-governmental organizations (NGOs) involved in development programs. Natural disasters have devastated an increasing number of regions (especially those in the developing phase), destroyed national and international investments, and set back progress gained with development. Developing countries are not able to reduce the impact of large-scale catastrophes because they lack building codes, land registration processes, regulatory mechanisms, and development itself. Also, they tend to prioritize other development projects and underestimate the risks presented by natural events. Finally, the quality of construction is very low in these countries, and the effects of natural phenomena are therefore catastrophic. The United Nations initiative for an International Decade for Natural Disaster Reduction (1990-99) has placed this concern at the top of the international agenda. International and national actors (UN agencies, the World Bank, NGOs, and donor countries) involved in the development of poor countries are now more concerned about prevention in their development programs.

DRM is considered an effective tool for protecting development projects, yet it is infrequently considered by developing countries in their programs (even in highly vulnerable countries). As such, developing countries are not able to effectively integrate a strategic approach to DRM into their national policy on their own, causing the poorest communities to suffer the most as a result. The improvement of living conditions and the promotion of a sustainable development are the core objectives of the organizations involved in the development of poor countries. They intend to pursue those goals by including natural risk reduction and mitigation

programs in their projects, for development can be sustainable only by preventing (or, at least, minimizing) the effects of natural disasters. In order to do so, they have set up programs and mechanisms aimed at supporting developing countries local institutions to develop their DRM capacity and include it in their national policy. Natural disasters are not a challenge to developing countries only; they are also a challenge for development cooperation. Strategies have been developed and implemented to reduce the vulnerability of populations in poor countries and to decrease disaster risk. Developing countries should strengthen their capability to manage natural disasters by allocating more resources to Disaster Risk Reduction (DRR) programs and by cooperating with developed nations to reduce their higher vulnerability to natural hazards.
